20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Design and integration support to flight test hardware was provided to the Naval Research Laboratory during the period 16 July 81 to 31 March 82. Computer hardware and software were developed to perform digital and analog input/output to a missile seeker. A PDP 11/23 and the necessary software were designed, installed, and tested to perform input/output and computer-to-computer communications. Methods of automatically booting a remote computer through another computer were developed and implemented. Software was written for a terminal switching network that would permit the connection of any CTS computer terminal

FOREWORD

The effort described in this report was performed for the Naval Research Laboratory, 4555 Overlook Avenue S.W., Washington, DC 20375. Quest Research Corporation, 6858 Old Dominion Drive, McLean, VA 22101 performed the technical effort from 16 July 1981 to 31 March 1982 under Contract N00014-81-C-2499. Contractor engineer was Robert B. Normoyle. The Naval Research Laboratory Contracting Officer Technical Representative (COTR) was Mr. Robert Surratt.

During the period of performance, three major tasks were completed:

- Installation of Harpoon seeker computer software and hardware.
- Testing of changes in ERP effects of target position.
- Feasibility of on-line graphics processor.

1.0 INSTALLATION OF HARPOON SEEKER COMPUTER SOFTWARE AND HARDWARE

The task where most support was concentrated was adapting a PDP 11/23 computer to act as a communications link between missiles and a network of computers. This support may be separated into six categories:

- a. Hardware implementation and evaluation of computer boards.
- b. Feasibility of using previously written software for the communications link.
- c. Creation of a more efficient software package.
- d. Program and network debugging.
- e. Creation and implementation of an automatic boot.
- f. Conversion of the new 11/23 software to run on the SM1 seeker computer.

1.1 Hardware Implementation and Evaluation of the Computer Boards

The PDP 11/23 consisted of an LSI 11/23 CPU, analog-to-digital (A/D) converters, digital-to-analog (D/A) converters, and serial and parallel input/output (I/O) devices. Each of these boards was completely tested to assure that they met Navy specifications. Calibration data was collected for the A/D and the D/A converters. The accuracy of these devices was determined to be within desired specifications. The computer I/O devices were then connected to the instruments and the communications links were tested. The instruments were then tested to assure that they react properly to various signals.

At present all hardware and communication links are capable of performing the designated tasks. Figure 1 is a block diagram of the I/O connected to the PDP 11/23.

1.2 Feasibility of Using Previously Written Software for the Communication Link

The PDP 11/23 is one of two computers that may be used to interface the network of simulation computers to the missile seeker. The other computer, a PDP 11/34, has been used in conjunction with an SM1 seeker. It was determined that time and cost would be saved if two computers were available for missile seeker to simulation network communications. The reasoning was that while one computer is being used in testing missiles, the other computer can be readied for future testing. This arrangement would reduce preparation time needed to make a different missile's seeker available for simulation tests.

One of the Three
Computers in the
Simulation Network

Seeker Computer

Harpoon

- A. 16 Bit Digital output from 11/23 to missile.
- B. 16 Bit Digital input to 11/23 from missile.
- C. 5 Analog Signals output from 11/23 to missile.
- D. 6 Analog Signals inputs to 11/23 from missile.
- E. 16 Bit Digital input plus 2 control Bits output from the PDP 11/23 to a I/O control computer a PDP 11/45.
- F. 16 Bit Digital output plus 2 control Bits input to the PDP 11/23 from the PDP 11/45.
- G. RS-232 Input/Output

FIGURE 1 INPUT/OUTPUT CONNECTIONS TO THE PDP 11/23

It was also determined that the software previously written for the PDP 11/34 would work on the PDP 11/23 with several minor changes. The PDP 11/34 software was not fully documented, thus a considerable amount of time was spent in determining how it worked, and if it would be possible to transfer the program to run on the PDP 11/23. Appendix A contains a copy of the key program that was documented. After documenting this program, it was determined that simulations capabilities could be enhanced if new software was written. The most important enhancement was to cut the seeker computer (the 11/34 or 11/23) frame rate from 4 milliseconds to below 2 milliseconds. The result was a more powerful and flexible software package for the PDP 11/23.

1.3 Creation of a More Efficient Software Package

The new seeker computer software package has many advantages over the previous 11/34 software package. Some of these advantages are:

- a. Frame rate is four times faster. The program may execute at a frame rate below 1 millisecond which is within the 2 millisecond requirement.
- b. Ability to select the number of D/A and A/D channels by program control.
- c. Ability to switch remote hardware in and out by computer control.
- d. Light emitting diodes (LEDs) are used to show that the program is operating properly. The LEDs may also be used to enhance system debugging.

The new program is contained in Appendix B.

1.4 Program and Network Debugging

Extensive testing of the program was performed to assure that all signal levels and digital I/O could be controlled properly. To preclude damage to the missile seeker, almost all debugging and testing was conducted before the seeker was connected to the seeker computer. After open-loop tests were completed, closed loop tests were performed. At this stage, software and hardware connected to the PDP 11/23 performed as predicted. The seeker computer in conjunction with the simulation network took full control of the missile seeker.

1.5 Creation and Implementation of an Automatic Boot

The final task to which support was provided was to streamline procedures necessary to prepare the simulator seeker computer for a simulation

run. Previously it required as much as two hours for several people to prepare the seeker computer for a simulation run. It is now possible to complete this same preparation in one to two minutes. A program that permits the automatic booting of the PDP 11/23 from a single user PDP 11 computer has been the major contributing factor. The user needs only to turn on the computers and type a few control words. A program in the host PDP computer will then automatically boot the PDP 11/23 and prepare it for a simulation run.

Programs used to perform this automatic booting are contained in Appendices C, D, and E. These programs are used in conjunction with H23 the data collection and communication routine contained in Appendix B.

Appendix F contains a program named TASM. This program will be used in the near future to help reduce the time required to develop and debug programs for the seeker computer.

A Z-80 microprocessor based assembly language program named TUDUM2.MAC is contained in Appendix G. This program was used to permit a user to select from a terminal a computer-to-computer serial link. This enables the operator to command the "A" processor to boot the PDP 11/23 via a serial terminal line.

1.6 Conversion of the New PDP 11/23 Software to Run on the SM1 Seeker Computer

Research has begun for the purpose of upgrading SM1 simulations to the level of sophistication of the Harpoon simulations. A minimum amount of change to the software used for the Harpoon simulation is required. The SM1 seeker computer should be back in operation by early May, 1982.

2.0

TESTING OF CHANGES IN ERP EFFECTS ON TARGET POSITION

It was determined that small changes in the Effective Radiating Power (ERP) had negligible effect on the target position within a quad. This result was determined by adapting a FORTRAN program so that it calculates individual antenna radiating power and phase if given a target position. The program changes the ERP for this position from 30 dB to -20 dB and calculates the resulting change in target position. Appendix H contains a copy of the FORTRAN program and Appendix I contains a sample of the results.

3.0

FEASIBILITY OF ON-LINE COLOR GRAPHICS PROCESSOR

Research was conducted into the possibility of using a color graphics display system to make simulation runs more informative. An extensive search was conducted to find a system that cost less than \$25,000 that would be able to display a real-time scenario of a missile flight along with target positions. Several companies such as Tektronics, Lexidata, Chromatics, and others appear to have graphic displays that will meet our real-time animation requirements.

A color graphics display system will enable users of the Central Target Simulator (CTS) to interpret results of experimentation faster and with a better perspective. At present, several slow displays are being used to show simulation results. Upgrading these display systems will make CTS more flexible and more productive for prospective users.

APPENDIX F
TASM

C PROGRAM: TASM.FTN

C AUTHOR: ROBERT B. NUNNOYLE
QUEST RESEARCH, INC
MCLEAN, VA 22101
PH: 821-3200

C PURPOSE:
SPECIFIC:

USED TO STRIP AWAY EXCESS DATA IN A "TASK FILE"
WHICH IS GENERATED BY THE PDP 11 TASK BUILDER. THE
REMAINING DATA IS ASSEMBLY LANGUAGE CODE WHICH MAY
BE SAVED IN A FILE FOR FUTURE USE. THE MOTIVATION FOR
THIS PROGRAM IS TO BE ABLE TO CREATE PROGRAMS ON THE
PDP 11/70 AND SEND THE CODE TO A COMPUTER THAT DOES
NOT HAVE AN OPERATING SYSTEM TO ASSEMBLE, COMPILE
OR EDIT PROGRAMS.
THE DATA CREATED BY THE TASK BUILDER INCLUDES THE
OBJECT FILES WHICH MAY RUN ON ANY PDP 11, WITH
OR WITHOUT AN OPERATING SYSTEM. IT ALSO INCLUDES
DATA WHICH IS ONLY NECESSARY FOR COMPUTERS THAT
HAVE AN OPERATING SYSTEM. THE FOLLOWING PROGRAM
IS USED TO CREATE A NEW FILE THAT CONTAINS ONLY
THE DATA REQUIRED TO RUN A PROGRAM ON A PDP 11
COMPUTER THAT DOES NOT HAVE AN OPERATING SYSTEM.
EXAMPLE: THE CTS SEEKER COMPUTERS PDP 11/23 AND
PDP 11/34
THE CODE OF AN ASSEMBLY LANGUAGE FILE STARTS IN
RECORD FOUR (4) OF THE CORRESPONDING TASK FILE.

C GENERAL:

USED TO EXAMINE ANY RECORD #HUSE BLOCK SIZE. IS 512
BYTES. THE PROGRAM IS ALSO CAPABLE OF STORING THE
ENTIRE INPUT FILE IN ANOTHER FILE, OR ANY PART
(OR PARTS) OF THE INPUT FILE IN ANOTHER FILE.

C NOTE:

THE INPUT AND OUTPUT FILE RECORD SIZE MAY BE
CHANGED TO SUIT USER FILE BLOCK SIZE. IN THE
OPEN STATEMENTS THE SPECIFIED SIZE MUST BE
4 TIMES SMALLER THEN THE BYTE SIZE OF EACH FILE
IN YOUR RECORD. WHEN CREATING A NEW TASK
FILE FOR THE ALTERED TASM.FIN PROGRAM, BE SURE
THE OPTIONS:
MAXBUFF = NBYTES
#NBYTES IS THE NUMBER OF BYTES IN A RECORD,
OR 4 TIMES THE RECORDSIZE STATED IN THE FORTRAN
"OPEN" STATEMENTS.

APPENDIX H
FTCRBN

AUTHOR: BILL MURKIS
CHANGES BY: MUREKI B. MURKIS
QUEST RESEARCH

DOCUMENTATION OF CHANGES

THE UPDATED VERSION OF FTC.FIN CALCULATES THE POWER AND PHASE OF EACH ANTENNAE IN A QUAD FOR A RANGE OF EFFECTIVE RADIATING POWER (ERP) OF 30 DB TO -20 DB.

THE OPERATOR TYPES IN THE FREQUENCY THAT HE WISHES TO USE, AND THE POSITION OF THE POINT THAT HE WISHES TO GENERATE. ALSO, HE CAN SPECIFY WHETHER HE WANTS THE OUTPUT ON THE CRT, OR BOTH THE CRT AND LINE PRINTER.

IF HE SPECIFIES THE LINE PRINTER THE PROGRAM WILL PRINT THE SAME INFORMATION THAT IS TYPED ON THE CRT, ALONG WITH THE CHANGE IN ATTENUATION AND PHASE.

THE DATA THAT IS PRINTED ON THE CRT AND THE LINE PRINTER (IF SPECIFIED) ARE:

1. ATTENUATION OF EACH ANTENNAE
2. PHASE OF SIGNAL IN EACH ANTENNAE
3. LOC OF POINT (0,0 IS CENTER OF ARRAY)
4. ERP
5. POLARIZATION
6. FEED: TWTA, GAAS, BOTH, ETC. ETC
7. OTHER DATA

THE ABOVE SIX ITEMS ARE PRINTED FOR BOTH FEED 1, AND FEED 2

NOTE: THE DATA FILE FOR YOUR OPERATING FREQUENCY MUST BE IN YOUR DIRECTORY. EXAMPLE:

FTC1680.DAT
THIS FILE IS DATA FOR OPERATING AT 1680 MHZ.
WHEN THIS PROGRAM ASKS FOR FREQUENCY THEN TYPE 1680
